

Figure 1 consists of three panels, each showing a graph of the probability of a correct response (C) versus the number of trials (N). The y-axis represents the probability of a correct response (C), ranging from 0 to 1.0. The x-axis represents the number of trials (N), ranging from 0 to 10. The panels are labeled 'Ind' (Independent), 'E' (Evidence), 'N' (Number of trials), '#', '#%', '=', and '/'. The data points are shown as green arrows pointing to the y-axis, and the curves are shown as black lines. The panels are labeled with the number of trials (N) and the probability of a correct response (C) for each level of evidence (E).

Panel 1 (Left): Ind *E% N # #% = /
67% 9 6 67% 0 0
H: 100%(9) P: (0) T: (0)

Panel 2 (Middle): Ind *E% N # #% = /
50% 6 3 50% 0 0
H: 83%(5) P: (0) T: 17%(1)

Panel 3 (Right): Ind *E% N # #% = /
. 1 0 0% 0 0
H: 100%(1) P: (0) T: (0)
